

ABSTRACT OF THE DISCLOSURE

[63] An electronic game device system is switchable between an amusement mode and a gaming or gambling mode and is useful for vehicles such as airplanes or boats which move geographically from jurisdictions where gaming is legal to jurisdictions where it is not. A GPS receive can be used to automatically switch the system between the modes, dependent upon the vehicle position. An improved method of operating a touch screen on a CRT or LCD computer screen uses finger release as input registering, and also may use highlighting of a button being selected with an enlarged button area for any highlighted button. Mounting arrangements for mounting computer screens or monitors are also disclosed for mounting between a transparent table top in e.g. a lounge area, and for mounting in seatbacks of airplane or other vehicle seats.
